Serial Peripheral Interface (SPI) - learn.sparkfun

Serial Peripheral Interface (SPI) is an interface bus commonly used to send data between microcontrollers and small peripherals such as shift registers, sensors, and SD cards It uses separate clock and data lines, along with a select line to choose the device you wish to talk to

Teoría y Aplicaciones

La mayoría de las interfaces SPI tienen 2 bits de configuración, llamados CPOL (Clock Polarity = Polaridad de Reloj) y CPHA (Clock Phase = Reloj de Fase) CPOL determina si el estado Idle de la línea de reloj está en bajo (CPOL=0) o si se encuentra en un ...

I2C Bus in AVR - Sharif

I2C • In the AVR up to 120 different devices can share an I2C bus - Each of these devices is called a node • Each node can operate as either master or slave - Master is a device that generates the clock for the system -Slave is the node that receives the clock and is addressed by the master - In I2C, both master and slave can receive or
